

Test Report

Project Name: TaskPro

Hazırlayan: Çiler Esen

Date: 20.05.2025

1. Introduction and Executive Summary

This report summarizes the API testing processes, findings, and results of the TaskPro project. The testing process was conducted in accordance with the plan created in Trello; test cases were developed and tracked in TestRail. TestRail Runs and Jira integration were utilized for defect tracking, while the Postman tool was employed for functional, performance, and smoke testing.

- **Test Scope:** All API endpoints defined in the Technical Specification and Swagger documentation have been tested.
- **Test Approach:** Manual testing (positive and negative) was performed for API endpoints, and performance and smoke tests were conducted using Postman.
- **Test Approach:** Manual testing (positive and negative) was performed for API endpoints, and performance and smoke tests were conducted using Postman.
- **Tools Used:** o Test Planning: Trello o Test Case Management: TestRail o Defect Tracking: Jira o API Test Automation: Postman o Documentation: Technical Specifications, Swagger API Documentation

1. Test Enviroment

<u>Core Category</u>	<u>Details</u>
Test Enviroment	QA Server
Base API URL	https://task-pro-qa.f.goit.study
API Version	V 001

2. Test Results Summary

Reports are attached.

3. Defect Summary Bugs

Reports are attached.

4. Recommendation for Program Improvement

Error Handling: Instead of server-side errors such as "500 Internal Server Error," more informative "4xx" (client-side error) status codes should be implemented.

Core Functionality: Urgent fixes are required for critical core functions such as user registration and profile updates.

UX/UI Consistency: Resolving visual and interactive issues, such as responsiveness flaws and notification icon glitches, will ensure a consistent and user-friendly experience across all devices.

Feature Functionality: Key features such as the "Need Help Form" and profile photo upload should be reviewed to prevent potential user issues.

Integration Points: Data flow and error management mechanisms, particularly in integration points like Google Account registration and profile updates, must be thoroughly analyzed.

Performance Testing: Performance tests should be repeated at regular intervals to monitor API behavior under load.

Documentation: Inconsistencies between the endpoint behaviors specified in the Swagger documentation and the actual application behavior must be resolved.
